

Andres Mercado

Software Engineer

andresam321@proton.me | [510-695-4124](tel:510-695-4124) | [LinkedIn](#) | [GitHub](#) | [Portfolio](#) | San Francisco Bay Area, CA

Backend-leaning software engineer working in Python, FastAPI, and PostgreSQL, building full-stack when a project calls for it. Experience includes production API integrations, AI-assisted document and outreach workflows, and deployed cloud infrastructure.

SKILLS

Languages: Python, JavaScript, SQL

Frameworks: FastAPI, Flask, SQLAlchemy, React, Redux, Vite

Databases: PostgreSQL, SQLite

Cloud & DevOps: AWS, Docker, Caddy, Route 53, S3

AI & Data: OpenAI APIs, RAG, Embeddings, Structured Outputs, OCR

Integrations & Auth: REST APIs, Google OAuth, Gmail API

Spoken Languages: English, Spanish

EXPERIENCE

Backend Engineer (Contract) — *Stacksync (YC W24)* June 2025 – September 2025

- Built production API connectors for Stacksync's real-time CRM/database sync platform, including integrations with external services such as Firecrawl and NeverBounce
- Designed schema-driven data mapping to normalize inconsistent external data into a structure the sync engine could reliably consume
- Cut connector implementation time in my own workflow from roughly three weeks to about one day after developing a repeatable structuring/mapping pattern

Line Service Technician — *Rabbit Aviation* September 2017 – August 2023

Fueled aircraft and coordinated day-to-day operations with pilots and customers at a general aviation airport.

PROJECTS

ContextFlow — *Personal Software Project | Live* 2026 – Present

Context-aware outreach platform — currently running in production.

- Built a production FastAPI/PostgreSQL/React-Vite platform with a PostgreSQL-backed background job queue: independent workers, SKIP LOCKED dequeue, and lease-based reclaim
- Designed audience-specific LLM prompt orchestration with a grounding-verification step before generated outreach is treated as ready to send
- Integrated Google OAuth, Gmail, and Resend for authenticated per-user sends and platform-level transactional email; deployed via Docker and Caddy on AWS

Propia — *Personal Software Project* October 2025 – Present

Backend-first lease intelligence platform. Built and deployed; backend/database intentionally stopped — not currently live.

- Built a document-ingestion pipeline with a separate OCR worker and structured lease-fact extraction, including a review/confirmation step before extracted data is treated as fact
- Implemented embeddings-based retrieval powering direct lease Q&A, validated with a dedicated evaluation harness rather than assuming output quality
- Built a California-specific compliance rules engine checking lease terms against state rules, plus security/correctness fixes (authentication timing, token handling, startup configuration checks)

EDUCATION

Software Engineering — *App Academy* June 2024

MERN Stack / Software Development — *Coding Dojo* April 2022
